

the Apollo[™]e

wireless curing light.

The New Curing Standard.

Fast Curing

This revolutionary light finally ends the curing controversy. The Apollo-e can cure ANY composite in the visible light spectrum (410nm - 500nm) quickly and safely. There's no need to change tips, and selecting YOUR composite is as easy as pushing a button. With a depth of cure up to 5mm, your composite is completely polymerized just as well on the inside as it is on the outside. Plus, you have the option of fast, slow or pulse curing. The choices are endless and they're all at your fingertips!

Revolutionary Technology

The Apollo-e light is based on a whole new and extremely efficient light source—light emitting diodes. LEDs have been heralded by universities worldwide as the ultimate light source for activating light cured materials in the mouth. The two main reasons being LEDs long and constant life span, and the complete absence of heat. Now, with DMD's patented lens system, you can achieve the perfect cure at ultra fast speeds with absolutely NO HEAT. Plus, LEDs never fade or fail, so you'll never change another light bulb again!

- No Heat
- No Bulbs
- No Cords
- User Friendly
- Technologically Advanced
